

THE HIDDEN COST OF CONVENIENCE

Food Delivery & Quick Commerce Analytics Dashboard — a decision-focused Power BI case study

01 · PROBLEM → SOLUTION

THE PROBLEM

Transactional data hides the real cost of convenience. Orders, revenue, discounts, packaging charges, customer behavior and delivery performance sit in separate analytical views, making it difficult to understand the complete customer and business picture.

THE SOLUTION

Built a 4-page interactive Power BI dashboard that moves from executive performance to convenience costs, customer behavior and quick-commerce experience — using DAX measures, dimensional analysis and interactive filters.

04 · DASHBOARD SHOWCASE

01 · EXECUTIVE OVERVIEW — overall performance, restaurant demand and revenue trend.

02 · COST OF CONVENIENCE — discounts, packaging charges and bill-impact bridge.

03 · CONSUMER & ORDER BEHAVIOR — trends, customers, order-value bands and restaurant mix.

04 · QUICK COMMERCE — platform AOV, delivery time, delays and product categories.

05 · KEY ANALYTICAL HIGHLIGHTS

RESTAURANT CONCENTRATION

Aura Pizzas is the dominant restaurant in the final comparative view for order volume and also leads packaging charges and restaurant discounts.

ORDER-VALUE DISTRIBUTION

The ₹500–₹749 band is the largest band in the cleaned dashboard view, with 141 orders.

CONVENIENCE COST

The report separates discounts and packaging KPIs and uses a bridge to explain how these components affect the final bill.

QUICK-COMMERCE EXPERIENCE

The dashboard tracks 100K quick-commerce orders, ₹590.99 AOV, 29.54-minute average delivery time and delivery-delay share.

INTERACTIVITY

Month, Restaurant, Platform and Product Category slicers allow users to move from the overall picture to specific segments.

DATA QUALITY

One unusually high-value restaurant order was excluded consistently from comparative restaurant views because it materially distorted the restaurant-level comparison.

RESUME PROJECT ENTRY

Built a 4-page interactive Power BI dashboard analyzing food-delivery and quick-commerce transactions across revenue, AOV, discounts, packaging charges, customer behavior, restaurant performance, delivery time, delays and product categories; developed reusable DAX measures, order-value banding and a convenience-cost bridge with data-quality handling for an extreme outlier.
